

§ Question number

1. IOT is a technology transition in which devices will allow us to sense & control the physical world by making objects smarter and connecting them through an intelligent network.

—————\*End of Solution\*—————

Question number 2

2. The basic goal of IOT is connect the unconnected. Objects that are not currently joined to the computer network should be connected so that they can communicate and interact with people and other objects.

§ ————— End of Solution —————

Question number

3. When objects and machines can be sensed and controlled remotely across a network, a tighter integration between physical world and computers is enabled.

End of Solution

Question number

- (4) Connected roadways is a term associated with both the driver and driver less cars fully integrating with transportation system

— End of Solution —

(5) Question number

Basic sensors reside in the case already. The need for all sensory information & control is for the driver to understand and handle critical decisions.
